

Figure 02: County Level Comparison

Xiaoyi Zhao, Pragati Dahal, Yuanyuan Wen

2026-07-12

Purpose

1. the purpose of this file is to generate the county comparison plot
2. the county comparison plot will compare the difference in similar spma but different composition

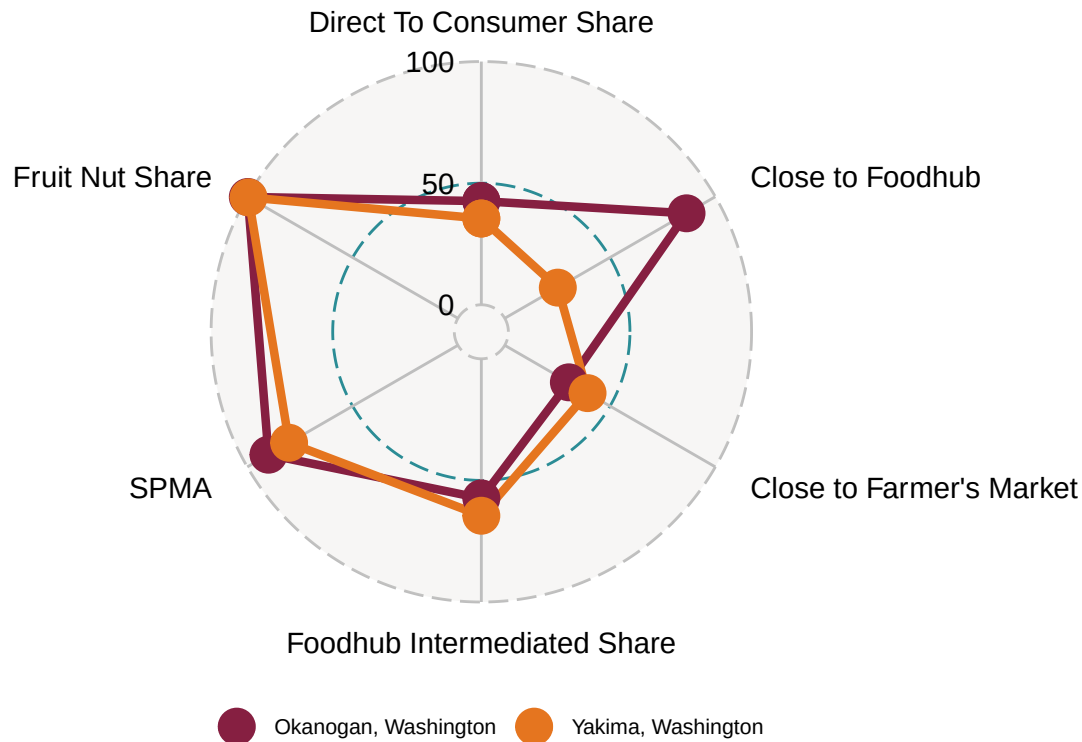

Note

- The index and the factors represented in the spider graph are percentile
- Since local intermediate sale percentage has a lot of missing values, this county comparison use $(1 - (\text{direct to consumer sales' share}))$ as the estimation of the food hub intermediated sale

County Comparison

Okanogan, Washington v.s. Yakima

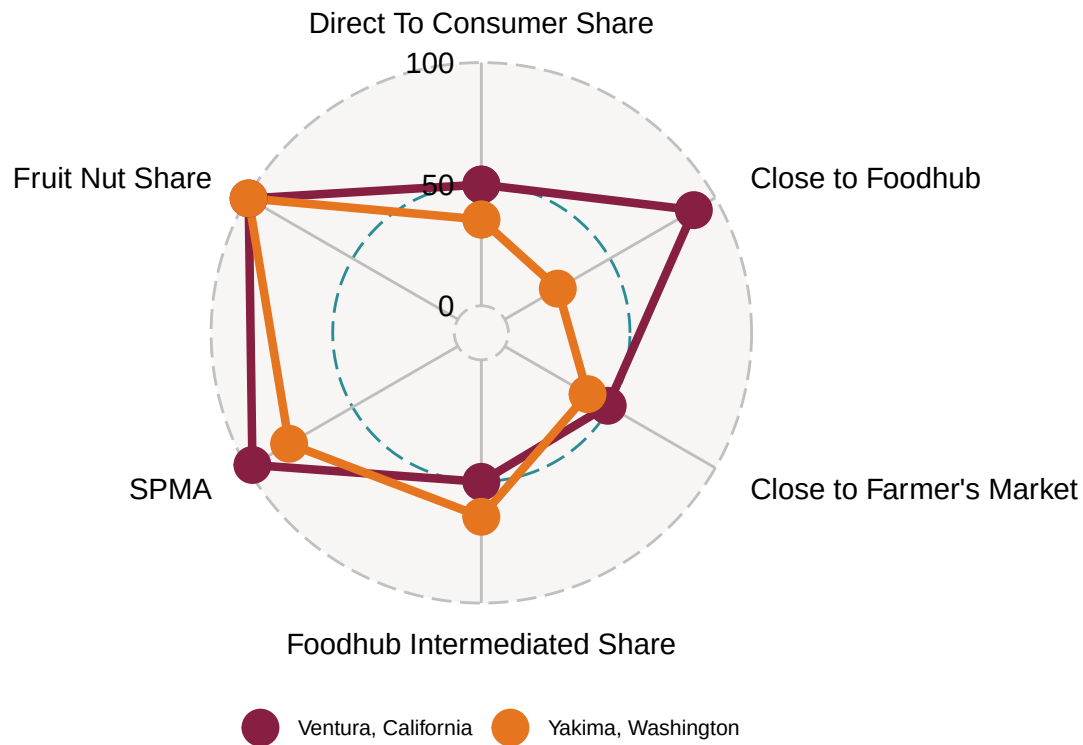

From Orchard to Opportunity: Food Hubs and Small Farm Market Access at the County Level

The story behind: Okanogan vs. Yakima gives us a clean hub vs. no-hub story. Both are major fruit&nut counties, and both have clean sales-composition data. The split is on food-hub access: Okanogan has 2 hubs with the nearest just 14.7 miles away, while Yakima although being the the larger, better-known producer has no food hub with its nearest hub 63.6 miles out. Here, the more famous producer actually scores lower on market access. This maybe a good story for USDA.

Ventura, CA v.s. Yakima , Washington

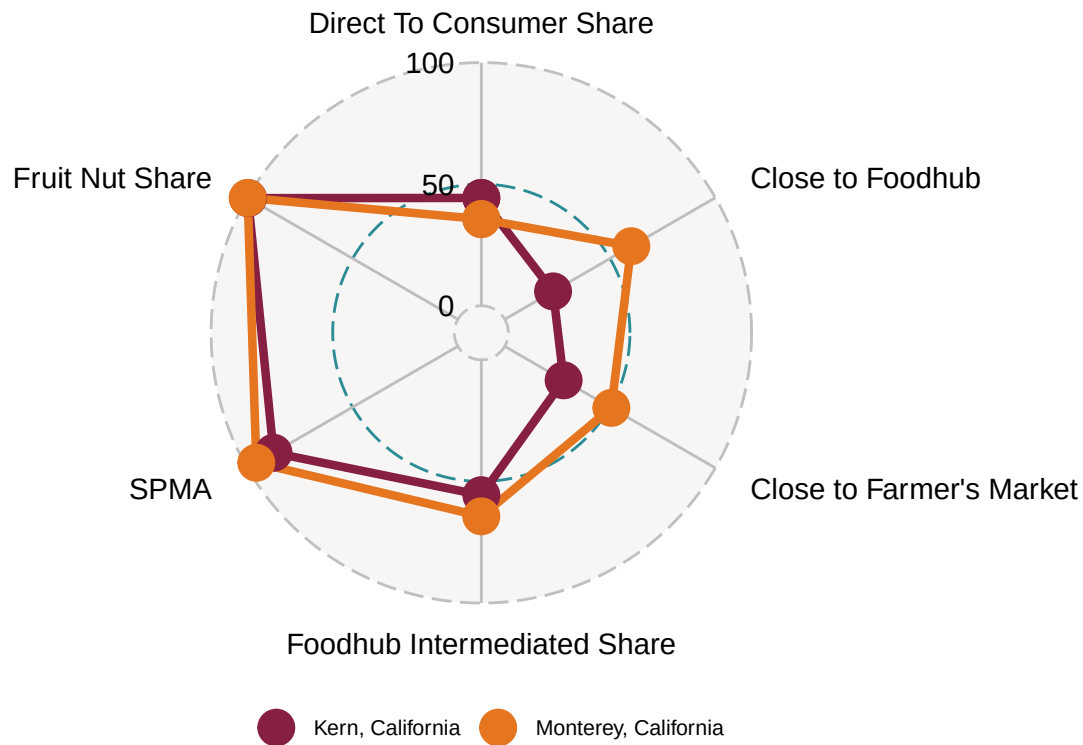

From Orchard to Opportunity: Food Hubs and Small Farm Market Access at the County Level

The story behind: Compared with Venture, CA, Yakima is much further away from foodhubs' locations. If there are closer foodhubs, the small farmers may have better accessibility to the market.

Monterey, CA v.s. Kern ,CA

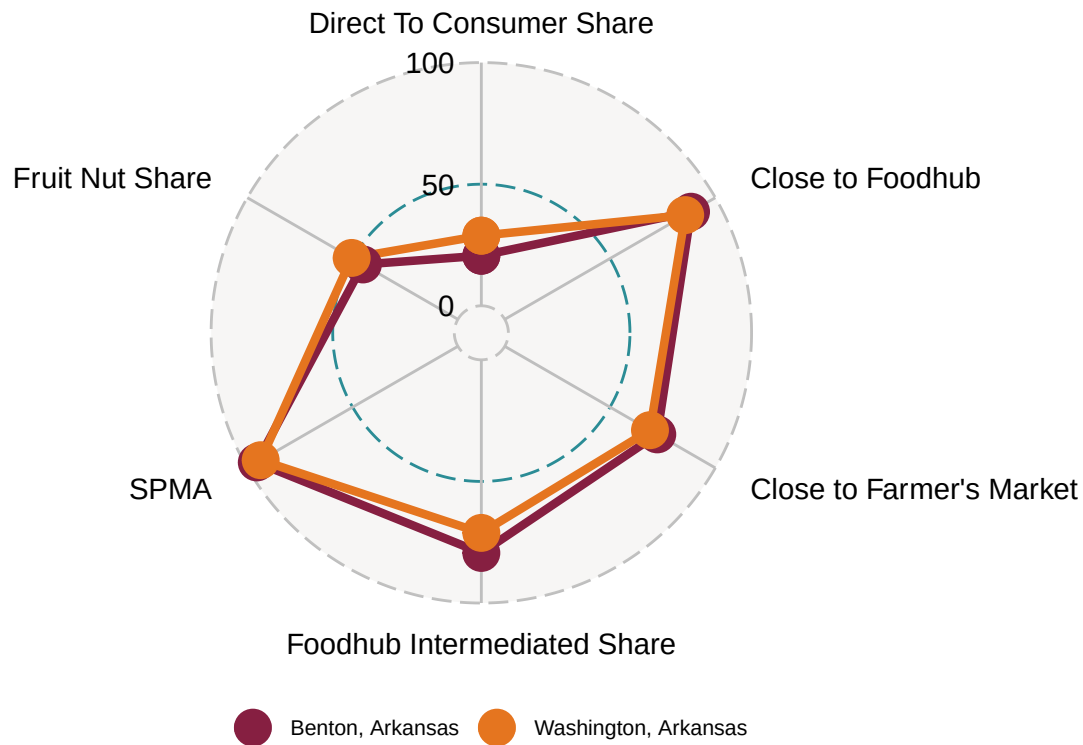

From Orchard to Opportunity: Food Hubs and Small Farm Market Access at the County Level

The story behind: Compared with Monterey, CA, Kern,CA is much further away from foodhubs' locations. If there are closer foodhubs, the small farmers may have better accessibility to the market. They're both big fruit&nut producers with similar total farm sales. The food hub gap is also clean: Monterey has 2 hubs, nearest one 31.6 miles, while Kern has zero and its closest is 67.8 miles away.

Washington, Arkansas v.s. Benton, Arkansas

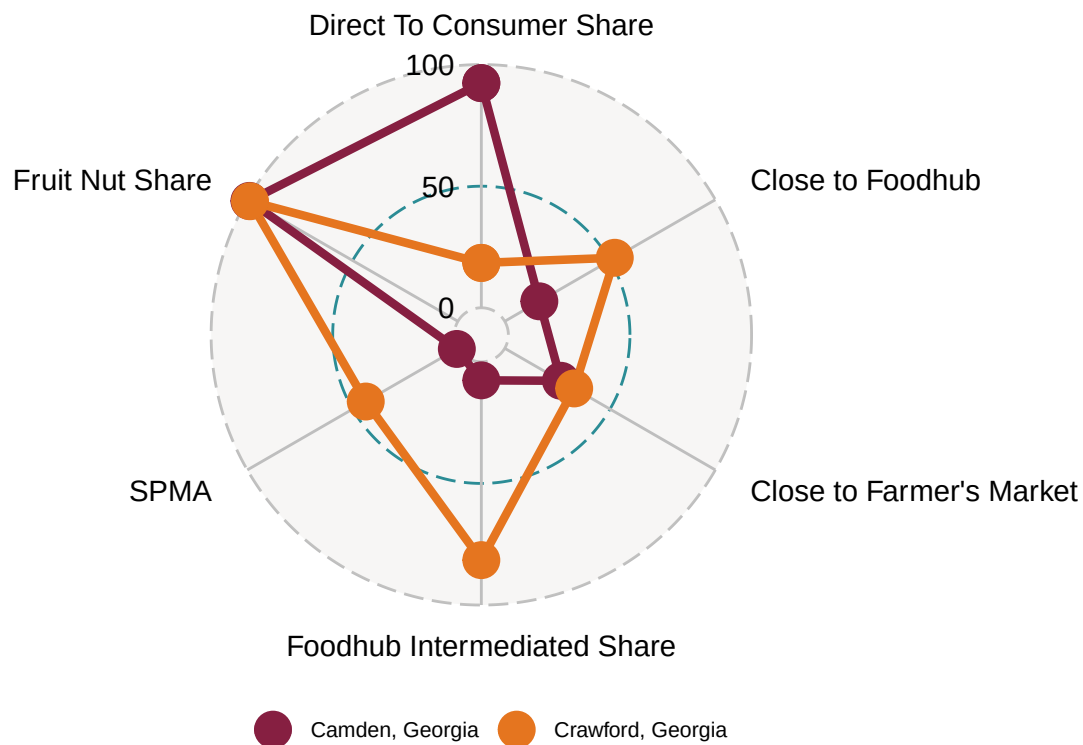

From Orchard to Opportunity: Food Hubs and Small Farm Market Access at the County Level

The story behind: Both are very close in SPMA and Fruit and Nut Share, but it is a good example showing how higher foodhub intermediated share and foodhub location can make up for lower direct to consumer share.

Grawford, GA vs Camden, GA

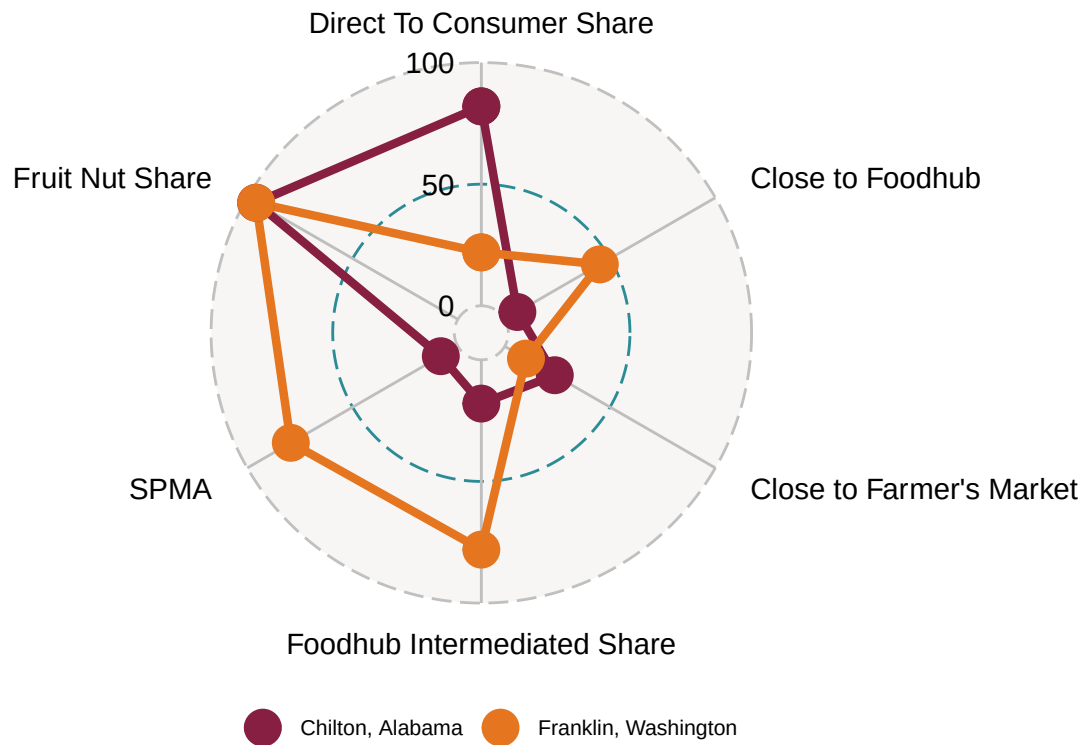

From Orchard to Opportunity: Food Hubs and Small Farm Market Access at the County Level

**The story behind*: This can be a good comparison in a state that is less mentioned, and in Georgia, since Crawford has higher foodhub intermediated sale and closer to foodhubs, the effect from foodhub makeup their lower direct to consumer sale share and make them have higher spam than Camden.

Franklin, WA vs. Chilton, Alabama

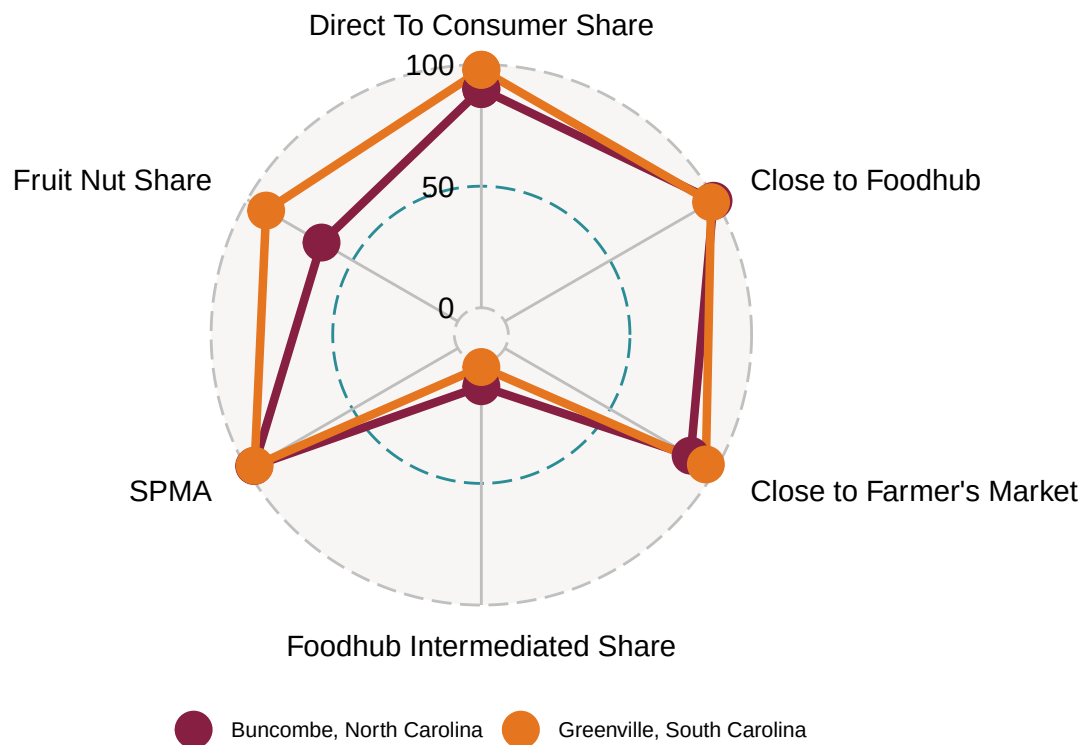

From Orchard to Opportunity: Food Hubs and Small Farm Market Access at the County Level

The story behind: This story is similar, as Franklin is closer to Foodhub and has higher foodhub intermediated sales, it has higher SPMA even though its direct to consumer sales share is lower.

Greenville County, SC v.s. Buncombe County, NC

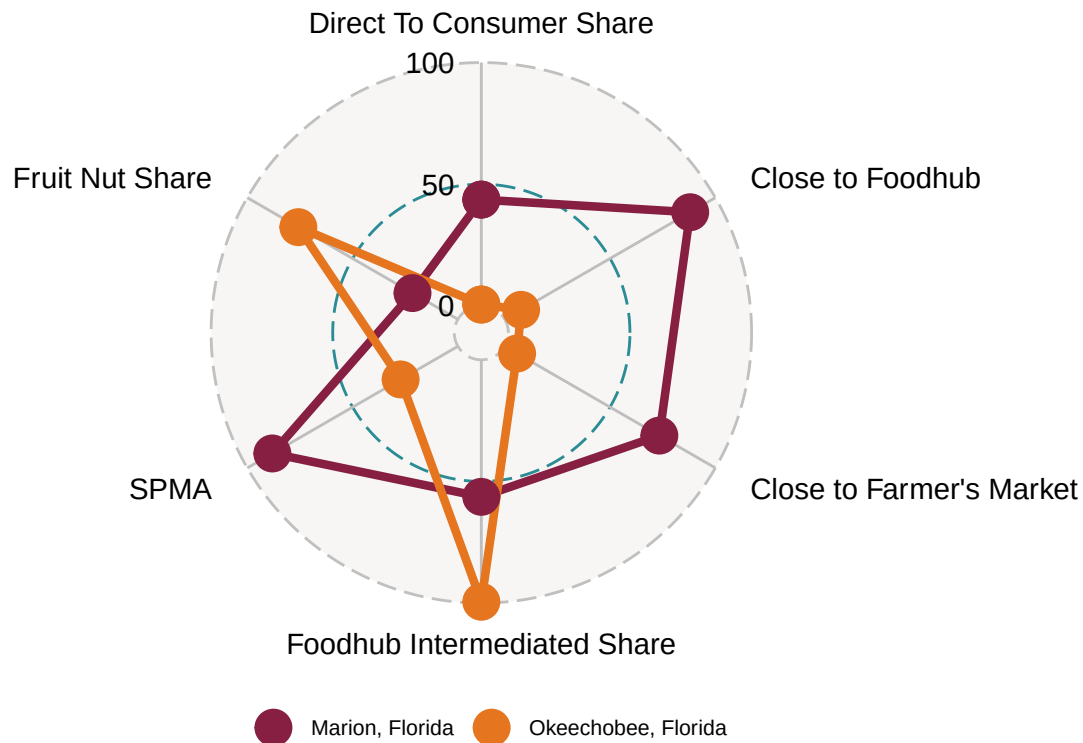

From Orchard to Opportunity: Food Hubs and Small Farm Market Access at the County Level

The story behind: This can be a demonstration that how foodhub allow the county has higher fruit nut share have higher market accessibility

Marion County County, FL v.s. Okeechobee County, FL

From Orchard to Opportunity: Food Hubs and Small Farm Market Access at the County Level

The story behind: We can imagine if Okeechobee is closer to foodhub, the farmers there will have higher accessibility to the market.
